BILATERAL SCREENING MAMMOGRAPHY WITH TOMOSYNTHESIS

History:

Screening. Aunt diagnosed with postmenopausal breast cancer.

COMPARISON: None. Baseline.

FINDINGS:

Density: ACR Category B: There are scattered areas of fibroglandular density.

No concerning mass, architectural distortion or suspicious microcalcifications

IMPRESSION:

No mammographic evidence of malignancy. Annual screening is recommended for patients of this age once mammography has begun

Recommendation: Screening in 1 year.

BI-RADS: 1.

October is Breast Cancer Awareness month, and we wanted to bring attention to the recently changed breast cancer screening guidelines for Alberta women. Women aged 45-74 are encouraged to attend and can now self-refer for routine breast cancer screening every 1-2 years.

Women aged 40-44 are encouraged to discuss breast cancer screening with their primary care physician and may request a requisition. After the first requisition, women 40-44 can self-refer annually.

Electronically Signed: Jason Novak 10/25/2023 1:50 PM MDT
