HISTORY: Intermittent pain in right breast. History augmentation

**BILATERAL DIAGNOSTIC MAMMOGRAPHY WITH TOMOSYNTHESIS - IMPLANTS  
ULTRASOUND RIGHT BREAST**

**History:** The patient describes intermittent pain in the right breast approximately 9 o'clock the last six months. No personal or family history of breast cancer.

**Mammogram:**

This is a baseline study.

The background breast parenchyma is almost entirely fat replaced (ACR category A).

Bilateral retropectoral silicone implants are seen. These appear intact with a normal contour.

No suspicious mass, architectural distortion, or suspicious microcalcifications in either breast.

**Ultrasound:**

Ultrasound of the patient's area of pain demonstrates normal breast tissue with no suspicious abnormality.

**IMPRESSION:** No mammographic or sonographic evidence of malignancy. No worrisome abnormality to account for the patient's concerns.

**BI-RADS: 1: Negative.**

**Recommendation(s):** Screening mammography recommended in 1 year.

*Electronically Signed: Dr. Hector Aguilar, FRCPC 12/23/2021 3:33 PM MST*
